

Logging Function

KEY BENEFITS

- History of programming pendant operation can be monitored and retained
- Aid in error diagnostics by reviewing changes made prior to events
- Can be combined with Password Function to note USER logged on when changes occurred

OVERVIEW

Stores and displays modifications such as editing data of the robot controller program (job) and welding condition, and the history (log) of programming pendant operation such as job execution.

Facilitates troubleshooting by ensuring data traceability.

Display, store and save (text file) 200 data edit events (job concurrent IO ladder, various condition files, edit of parameters, variables and others).

Display, store and save (text file) 100 pendant operations (job start, hold, emergency stop external memory load and save, and others).
